Initially, the new layer you create will be an image layer. When you're ready to work with the layer, you can convert it to a group or a raster layer. You can continue to edit the layer as a group or use its Set Layer Blend Mode feature to keep it from affecting other layers in the file. In general, you can convert a layer into a group whenever you're comfortable with editing the group of layer. For example, if you make edits to the group of a layer, then it changes the entire group of it, not just that layer. If you create a new layer, there is nothing to group. In the case, the conversion into a group is trivial. For a layer to be grouped, simply right-click on the layer, select 'Group', and 'OK'. The two programs are very similar: both have the same basic functions, the same interface, the capabilities of editing RAW photos is the same (though Photoshop explicitly doesn't do raw.) One major difference is that Lightroom is free and Photoshop is not. The workflow differs a bit as well. Photoshop is designed for a less-interactive workflow, while Lightroom is designed for a more-interactive workflow, but the two programs can work in tandem to accommodate each other. e3d0a04c9c
