Photoshop is an immensely powerful image-editing program. It's hard to find those features that are new. Most of the software industry has been revising its programs for the past few years, so it feels like many of the new features already exist and are simply waiting for you to discover them. That said, there have been a number of added features that are new to Mac and are nice in any case. First of all, it is important to stress that in the first place, the newest version of Photoshop is an overhaul of its UI as well as its functionality. With the previous versions, this tool always seemed like it was ready to fall apart at every corner. Now, it is a uniform, complete package. The new design of the user interface is much easier to use, and it lets you work faster. Everything is where you expect it, and it's nicely organized. The new version of Photoshop is set in the modern era of web design. When you open a file in Cloud Documents, you're asked what type of version you want (the old versions are saved as documents). You can also choose whether you want to delete the document. Before opening a file that's been shared with you, if you're signed in to the service, you're asked if you want to allow access to the document. You can share as many or as few projects as you like, but you can also share with up to 15 people. So far, the ability to overwrite a document doesn't seem to apply to the iPad version of Photoshop. You can also add comments. While we haven't seen a final release, the feature does appear to work pretty well. LinkedIn and WeChat integration makes collaboration easier as and when you want to, with the latter adding the ability to share and export projects on the same platform.

Elements' automatic correction panels had been a costly option in the more powerful Adobe Photoshop, but in Elements 20, they're now available at no additional cost. Elements 20 includes a new option to change the default color tab from RGB (red, green, blue) to sRGB (standardized Red, Green, Blue). This option could set the documents' colors to align with customer printing and online viewing settings, though not all of Elements' features offer this setting. Images coming in as more jagged edges for any shape or area. The v20 update solves this by introducing new edge handling, as seen in the tool, allowing to hide those jagged edges (right-click -> Edit Edge style), control the sharpness of the reference edge (right-click -> Edit Edge control) and the brightness of the reference edge (right-click -> Edit Edge brightness) There are a few other reasons: The layers in elements have some advantages over the Photoshop layers. They can be renamed individually, organized logically, moved out of the way, or copied entirely. The rename functionality is pretty weak right now, but who knows, maybe it will improve in the future. It isn't quite at feature parity, but it's pretty close. And with the new version of the Photoshop file format, non-Adobe editors are aware of layers if they open an Adobe registered document. Once Elements is opened, you can even use layers from Photoshop files that aren't registered. You do have to make sure to toggle the shape layer visibility and rename to a layer name you want; it won't save the names of the original Photoshop layers by default. But the layers are there in this version of Photoshop. You can also load the same generic Photoshop file into both Photoshop and Elements 20 simultaneously without a problem. We only tried this with one layer, though, so it may not work with all of them.
